

## Guidance on Brief Oral Papers

Oral paper presentations serve as a brief opportunity for dissemination of information related to a meaningful project, such as a survey or investigational study, or a review of programmatic innovation related to clinical care. They are the best place at the meeting to present original research and disseminate new developments in C-L Psychiatry. Meaningful literature reviews on a topic, with or without an included case, may be considered if the content is considered to contribute in an important way to the available literature. The topic must be considered relevant and specific to C-L Psychiatry.

Brief oral papers are approximately 10-15 minutes in length, delivered by one speaker, and clustered into multi-paper sessions by theme. Presentations consist of a brief didactic learning format utilizing slides. At the live meeting, a Program Committee-appointed discussant moderates the session and decides how the available discussion time will be apportioned.

Brief oral paper abstracts are graded according to their value in the following areas: clinical applicability, originality, scientific content, and overall quality.

Slots for brief oral paper presentations are limited. If the Program Committee cannot accommodate your submission as a brief oral paper presentation, provided you indicate a willingness to accept an alternative presentation type in your abstract submission, you will be offered the option for poster presentation.

Please review the additional information on the poster and brief oral paper submission process, which includes the Academy's guidelines for recommended abstract format.

### Examples

Here are good examples of oral paper abstracts selected for the 2021 program:

- [Dlin/Fischer Clinical Research Award: Impact of Co-locating Mental and Behavioral Health Providers with Primary Care Providers and Specialists on Patient Outcomes](#)
- [#BlackLivesMatter to CL Psychiatrists: Examining Racial Bias in Clinical Management of Behavioral Emergencies in the Inpatient Medical Setting](#)
- [WEBB FELLOW - Respiratory Depression Risk with Co-administered Parenteral Olanzapine and Benzodiazepines: A Retrospective Study](#)
